# **SITUATIONAL ORDER FLOW**

“Why be a sheep in the markets when you can be a wolf and track order flow?”

# Situational Order Flow

## Module 1 – Combining Price Action With Order Flow.

# Situational Order Flow

## Disclaimer

This course is for educational and informational purposes only and should not be considered a solicitation to buy or sell a futures contract or make any other type of investment decision. Futures trading contains substantial risk and is not for every investor. An investor could potentially lose all or more than the initial investment. Risk capital is money that can be lost without jeopardizing one's financial security or lifestyle. Only risk capital should be used for trading and only those with sufficient risk capital should consider trading. Past performance is not necessarily indicative of future results.

CFTC Rules 4.41 - Hypothetical or Simulated performance results have certain limitations, unlike an actual performance record, simulated results do not represent actual trading. Also, since the trades have not been executed, the results may have under-or-over compensated for the impact, if any, of certain market factors, such as lack of liquidity. Simulated trading programs in general are also subject to the fact that they are designed with the benefit of hindsight. No representation is being made that any account will or is likely to achieve profit or losses similar to those shown.

## Module 1 – Combining Price Action With Order Flow.

Most traders focus on price action when making decisions about their trades. However, price action alone can only tell you so much about what's happening in the market. Order flow is the other key piece of information that can help you to get a fuller picture of what's going on. By combining price action with order flow, you can get a better sense of which way the market is likely to move and make more informed trading decisions.

## Module 1 – Combining Price Action With Order Flow.

When you look at price action, you're only seeing one side of the trade. You're not seeing how many contracts are changing hands and at what price, and you don't know why those trades are being made. Is it a large institution buying or selling? Is it small retail traders following a trend? Or is it just noise? Order flow can give you clues about why trades are being made, and that can help you to make better predictions about where the market is heading.
